                                                                                                                                                                                                 CC sequences, corresponding to human secreted proteins. AAX6451 to CC AAX65438 represent the EST related proteins corresponding to AAX4265 to AAX63052. The 5' ESTs can be used for producing secreted human gene CC products. They can be used to identify and isolate 5' untranslated C regions (UTRs) and upstream regulatory regions which control the CC location, development stage, rate, and quantity of protein synthesis, as CC well as stability of mRNA. The ESTs are also useful as probes for CC well as stability of mRNA. The ESTs are also useful as probes for CC also be used in forensic procedures to identify individuals, or in CC diagnostic procedures to identify individuals, or in CC diagnostic procedures to identify individuals having genetic diseases resulting from abnormal gene expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be used for directing extracellular secretion of a polypeptide or the CC insertion of a polypeptide into a membrane, or importing a polypeptide or the control artists of them conditions. Secreted proteins have CC therapeutic value, and the identification of new secreted proteins is CC callable. AAX42264 to AAX42264 and AAX46640 represent

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene

ABG17822
   This sequence represents human histone H2A.21. The protein has a complecular weight of 21 kD, and has 98% identity and 100% homology with human histone H2A.1 (GenBank accession number M60752) over an 84 camino acid stretch. The invention relates to human histone H2A.21 (ARB73702), nucleic acids encoding it (ARB24271), and a method for the recombinant production of human histone H2A.21. The present invention additionally discloses an antibody which specifically binds to human histone H2A.21. The present invention additionally discloses an antibody which specifically binds to human can histone H2A.21. The present invention may be used for treating a variety of diseases, such as malignant tumours, blood diseases, HIV (human immunodeficiency virus) infection. Immune disorders and inflammatory conditions. The protein may also be used to screen for modulators of its activity or for peptide fingerprinting identification. The polynucleotide can be used as a primer for nucleic acid amplification reaction or as a probe for hybridisation reactions, or in producing gene chips or microarrays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   for identifying expressed genes. (I) is useful in gene therapy techniques (C) to restore normal activity of (II) or to treat disease states involving (C) (II), (II) is useful for generating antibodies against it, detecting or cyantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical considers involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC anino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention. CC diagnostic amino acid sequences of the invention. CC diagnostic amino acid sequences of the invention of the printed control of the sequence data for this patent did not appear in the printed control of the polypeptication, but was obtained in electronic format directly from WIPO at the printed control of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     infection, or may result from an autoimmune disorder, a coagulation disorder (e.g. haemophilia), inhibition of tumour cell proliferation suppression of an inflammatory response or treatment of a nervous system disorder such as Alzheimer's disease. Detection of the presen or increased expression of the polynucleotide or the protein it encodes is useful for the diagnosts and/or prognosis of one or more types of cancer. The polynucleotide and polypeptide can be used as nutritional sources or supplements and in the screening of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          by a bone marrow-expressed polynucleotide. The polynucleotide and the polypeptide encoded by it are useful in the treatment of various immune deficiencies and disorders. The deficiencies and disorders may be genetic, may be caused by a viral (e.g. HIV), bacterial or fungal infertion or may result from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                31-MAR-1999;

                                                                                                                                                                                                                                   The present sequence is one of 251 novel human polypeptides encoded CC by a bone marrow-expressed polynucleotide. The polynucleotide and the polypeptide encoded by it are useful in the treatment of various commune deficiencies and disorders. The deficiencies and disorders may be caused by a viral (e.g. HIV), bacterial or fungal confection, or may result from an autoimmune disorder, a coaquiation, cc suppression of an inflammatory response or treatment of a nervous cystem disorder such as Alzheimer's disease. Detection of the presence or increased expression of the polynucleotide or the protein it encodes is useful for the diagnosis and/or prognosis of one or more types of cancer. The polynucleotide and polypeptide can be used as nutritional sources or supplements and in the screening of chemical compounds as potential drugs.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DB

SUBUNIT: Heterodimer of an alpha and a beta subunit. The alpha subunit binds DNA as a monomer and through the Runt domain. DNA-binding is increased by heterodimerization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ossification of the calvaria), supernumerary teeth, short stature, and other skeletal changes. In some cases defects in RUNX2 are exclusively associated with dental anomalies.

SIMILARITY: CONTAINS 1 RUNT DOMAIN.

ALTERNATIVE PRODUCTS: 3 isoforms; 1/Cbfala (shown here), 2 and 3/Cbfalb; are produced by alternative splicing.
TISSUE SPECIFICITY: Specifically expressed in osteoblasts.
DOMAIN: A proline/serine/threonine rich region at the C-terminus is necessary for transcriptional activation of target genes and contains the phosphorylation sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DISEASE: Defects in RUNX2 are the cause of cleidocranial dyspects. CCD), an autosomal dominant skeletal disorder with high penetrance and variable expressivity. It is due to defective endochondral and intramembranous bone formation. Typical feat include hypoplasia/aplasia of clavicles, patent fontanelles, wormian bones (additional cranial plates caused by abnormal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 similarity)

enhancers, osteocalcin, osteopontin, bone sialoprotei collagen, LCK, IL-3 and GM-CSF promoters.

SUBUNIT: Heterodimer of an alpha and a beta subunit subunit binds DNA as a monomer and through the Runt d binding is increased by heterodimerization.

SUBCELLULAR LOCATION: Nuclear.

ALTERNATIVE PRODUCTS: At least 9 isoforms; 1 (shown h 3/PEBP2-alpha A1, 4/PEBP2-alpha A2, 5/G1, 6/G2, 7/U1, 9/Y2; are produced by alternative splicing.

TISSUE SPECIFICITY: Found in thymus and testis, T cell TISSUE SPECIFICITY: Found in thymus and testis, T cell Tissue and testis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 differentiation and skeletal morphogenesis. Essential maturation of osteoblasts and both intramombers.

Novel human diagnostic protein #9502

ABG09511;

ABG09511 standard;

Protein;

449

A

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess WPI; 2001-639362/73. N-PSDB; AAS73698. Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder. Drmanac RT, Liu C, 31-MAR-2000; 2000US-0540217 23-AUG-2000; 2000US-0649167 30-MAR-2001; 2001WO-US08631 11-OCT-2001. WO200175067-A2 Homo sapiens. (HYSE-) HYSEQ INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase data are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II), (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating conditions in the polypeptide and polynuclectide sequences have applications in the polypeptide and polynuclectide sequences have applications of conditions in the produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human conditions and sequences of the invention.

Consider the sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC the polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations are responsible for genetic disorders or other traits to assess biodiversity amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed content of the major of the invention.

(I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polynucleotides are also used in diagnostics as expressed sequence tags of identifying expressed genes. (I) is useful in gene therapy techniques of contractions and as the contraction of contractions of contracting an expressed genes. (I) is useful in gene therapy techniques of contracting a polypeptide in tissue, as molecular weight markers and as contracting of sites expressing (II). (I) and (II) are useful for treating contractions of sites expressing (II). (I) and (II) are useful for treating contractions in the production expression or biological activity. Contracting a polypeptide and polypucleotide sequences have applications in contractions in contractions of gene mapping, identification of mutations contractions in contractions of the contractions of contractions contractions contractions contractions contracti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
Best Local
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes,
                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders involving aberrant grotein expression or biological activity. The polypeptide and polynucleotide sequences have applications in cidanostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and camino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                    The present sequence represents a bay scallop abductin polypeptide. The polypeptide is capable of chemomechanical transduction or inverse temperature translition. Abductin polypeptides contain glycine-rich sequences. Abductin polypeptides are useful in the manufacture of drug delivery vehicles for administering water soluble drugs. The abductin polypeptides and their derivatives are also useful in the manufacture of broad range of biomaterials ranging from light-weight durable fabric for clothing to matrices useful for human tissue and

                                                                                                                                                                                                                                                                The present sequence represents a bay scallop abductin polypeptide. The polypeptide is capable of chemomechanical transduction or inverse temperature transition. Abductin polypeptides contain glycine-rich sequences. Abductin polypeptides are useful in the manufacture of drug delivery vehicles for administering water soluble drugs. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes isolated nucleic acid molecules which encode fumonisin degradative enzymes and transporters from a Bacterium 2412.1 fumonisin catabolic gene cluster. The Bacterium 2412.1 was isolated from maize. The nucleic acid molecules can be used for producing an enzyme for detoxifying fumonisin or a structurally related mycotoxin, e.g. in harvested grain, or processed grain which is to be used as animal feed or silage. Ruminal microorganisms transformed with the nucleic acid molecules can be used as probiotic compositions or as feed inoculant compositions. Plants transformed with the nucleic acid molecules can be used as probiotic compositions or as feed inoculant compositions. Plants transformed with the nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      molecules can degrade or transport fumonisin and can reduce the pathogenicity of a fungus producing fumonisin. The plants may be e.g. maize, sorghum, wheat, tomato, soybean, alfalfa, sunflower, Brassica, cotton or rice. The products can also be used as detection reagents for fumonisins and related compounds. AAZ91253 represents the Bacterium 2412.1 fumonisin catabolic gene cluster, and AAZ91254 to AAZ91273 represent isolated nucleic acids from Bacterium 2412.1 which encode
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid molecules which encode fumonisin degradative enzymes and transporters, used for detoxifying fumonisin or related mycotoxin or reducing the pathogenicity of fungi producing fumonisin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY80085 to AAY80104. AAZ91286 to AAZ91291 represent sequence used in the exemplification of the present invention. AAZ91274 to AAZ91285 are given in the sequence listing from the present specification but are not

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid genes from Drosophila and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            23-MAR-2000;

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL101840-ABL16175) and the encoded proteins sequences (ABL01840-ABL16175) and the encoded proteins

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating
                                                                 inverse fabric;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

                                                                                                                                                                                                                              The present sequence represents a bay scallop abductin polypeptide. The polypeptide is capable of chemomechanical transduction or inverse temperature transition. Abductin polypeptides contain glycine-rich sequences. Abductin polypeptides are useful in the manufacture of drug delivery vehicles for administering water soluble drugs. The abductin polypeptides and their derivatives are also useful in the manufacture of broad range of biomaterials ranging from light-weight durable fabric for clothing to matrices useful for human tissue and
